Northstar Incident Runbook

Revision 2 | Fictional demonstration material

Purpose

This runbook defines the first response for a production service incident at Northstar Field Services. The incident lead records the timeline and coordinates responders.

Critical incident response

For a critical incident, the on-call engineer opens an incident channel immediately. The incident lead notifies the Security on-call within 15 minutes of confirming the incident. The service owner provides a customer impact estimate and a next update time.

Recovery target

The initial restoration objective for a critical service is two hours from incident declaration. Responders must preserve relevant logs and record any emergency change in the incident timeline.

Related operating guidance

Vendor-hosted data incidents also use the Northstar Vendor Operations Guide. The guide is separate controlled material and must be consulted for vendor bridge steps.

Revision note

Revision 2 reduces the Security notification window from 30 minutes to 15 minutes and the initial restoration objective from four hours to two hours.

Synthetic demo content. Not a real policy or operational instruction.
